

Setting up BOSS on a Mac

This is the Mac guide. On a Windows PC, open **INSTALL-WINDOWS.pdf** instead. Following the wrong one sends you looking for things your computer does not have.

Two parts. **Part 1** builds your Business Brain. **Part 2** installs your Operating System. Do them in that order.

You need: your laptop, and Claude Pro or higher. The free plan will not work.

One naming thing before you start. The app you download is called Claude. Your system is called **BOSS**, and it lives inside Claude. When this guide says BOSS, it means your system talking back to you.

Your screen may look a little different than the pictures. Older computer, newer computer, it changes. **Follow the words, not the picture.**

What it looks like while it's working

Read this before you start, because it is the thing that makes people think they broke something.

BOSS talks while it works. It will say things like *"I found an error," "that path was wrong, fixed it," "this one is missing, installing it now."* Sometimes for a long stretch.

That is the system working. It is not the system breaking.

You are hiring more than a hundred employees at once. Train a hundred real people on their first day and things go sideways all day long. The difference here is that BOSS finds its own problems, fixes them while you watch, and tells you it did. The talking is the repair.

Some steps take a long time. Installing takes minutes. Setting up your system takes 45 to 60 minutes. A screen that looks stuck is usually a screen that is working. Let it run. It stops and asks you clearly when it needs you.

When something actually is wrong

Do not go poking at it yourself. Do this, in this order.

1. **Take a screenshot** of whatever you are looking at.

2. **Give the screenshot to BOSS and ask it to fix itself.** Drag the picture straight into the same session and say *"fix this."* It reads its own errors and repairs them more often than not. Try this first, every time.
3. **Bring it to office hours, ask on the call, or post it in the Facebook group.** Say which step number you are on and post the screenshot. Somebody else has usually hit the same thing.

Do not email anyone. It does not get you an answer faster. The three above do.

Part 1: Build your Business Brain

1. Open Claude Desktop

Claude Desktop is the app on your computer, not `claude.ai` in a browser tab. If you do not have it, download it at **`claude.ai/download`**, sign in, then drag Claude into your Applications folder.

2. Click Code, then New session, then Select folder

Click **Code** at the top. Start a **new** session. Click **Select folder**.

Pick your **Desktop** from the list on the left side of the picker. Any folder works here. BOSS builds the right folder for you in the next step.

3. Click Trust

Claude asks once whether you trust this folder. Click **Trust**.

4. Your Mac asks a second time. Click Allow.

This is the step that throws people, so read it before it happens.

macOS controls which apps can see your Desktop, Documents and Downloads. The first time Claude reads a folder in one of those, **your Mac** puts up its own box: *"Claude would like to access files in your Desktop folder."*

Click **Allow**. It is a different box from the Trust one, it arrives second, and it looks like an error. It is not. It only asks once.

Clicked Don't Allow by accident? Apple menu, System Settings, Privacy and Security, Files and Folders, switch Claude back on.

5. Copy this one line and paste it in

Copy the line below. Click in the chat box. Paste it. Press return.

Set up my BOSS Business Brain. Download <https://github.com/Krista-Mashore-Coaching/boss-business-brain-download/releases/latest/download/BOSS-AI->

Business-Brain.zip and unzip it so that the file START-HERE.md sits directly inside a folder named BOSS-AI-Business-Brain in my Sites folder (create Sites in my home folder if it does not exist, and do not leave an extra folder in between). Delete the zip. Then tell me, in three short steps for Claude Desktop and never Terminal: click Select folder, choose Sites and then BOSS-AI-Business-Brain, click Trust, and say hi. Do not ask me any questions until it is unzipped.

It is the one that starts with "Set up my BOSS Business Brain." It looks long. That is fine. You do not need to read it or understand it. Copy the whole thing and paste the whole thing.

Got here by scanning a QR code on your phone? Type your email in on that page and open the email on your computer. The line to paste is in it.

6. BOSS downloads it

BOSS downloads the file, builds your folder, unzips it, and deletes the zip. When it is done, it tells you exactly what to do: click **Select folder** again, choose **Sites**, then **BOSS-AI-Business-Brain**, click **Trust**, and say hi.

7. Say hi

You do not type anything special. Say hi, or say nothing at all, and it starts on its own.

It asks you questions and writes your files while you answer. About 90 minutes.

Want to talk instead of type? Hold the microphone key on your keyboard and answer out loud. Most people go a lot faster this way.

8. Create your free GitHub account when it asks

Near the end it walks you through it and saves your username. Two minutes.

When you finish

Keep that folder. Do not move it, do not rename it, do not delete it. It is your brain, it is your backup, and you open it again in Part 2.

Part 2: Install your Operating System

Yours, for one business. This system is licensed to you. Copying it, sharing it, or installing it for anyone else breaks the agreement you signed. Every copy is tied to the GitHub account it was installed under, so a copy that turns up somewhere else can be traced back, and Krista's team will take legal action. A business partner named on your signed partnership agreement is covered. Nobody else is.

Every step below matches a slide in the video, so you can follow either one.

Before anything: did you sign your contract? (slide 2)

If no, **stop here**. Nothing below works until you do.

Getting your GitHub account

1. Open Chrome. Search: github (slide 3)

Click the first result that says GitHub.

2. Click Sign up (slide 4)

Top right corner. You get a black page that says **Create your free account**. Work through it. (slide 5)

3. Find your user name (slide 8)

- Click **your picture** in the top right corner
- Your user name is at the top of the menu
- **Write it down exactly. Every letter.**

4. Go to kristamashore.com/phase2 (slide 9)

Fill in:

- Full Name
- GitHub Username
- Phone
- **Email. The SAME email you used for GitHub.**
- Agent or Lender

Click **Submit**. You know it worked when the confirmation page comes up. (slide 10)

5. You get TWO emails (slide 11)

- One says **Access Granted to BOSS System**. Close it.
- One from **KMC-coaching** is your invitation. **This is the one.**

6. Open the KMC-coaching email (slide 12)

It has the GitHub logo at the top. Scroll down. Click the blue **View invitation**.

This invitation runs out in 7 days. Do it now.

7. Click the green Accept invitation (slide 13)

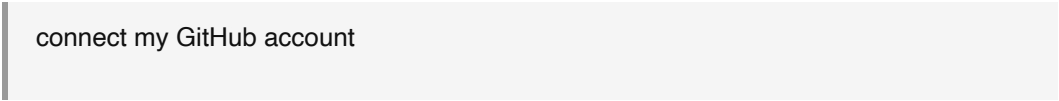

Do **NOT** click Decline invitation.

You are in when a blue bar says **You now have view access.** (*slide 14*)

Handing your account to BOSS

8. Type this exactly (*slide 16*)

In Claude, type:

connect my GitHub account

Press return.

9. It asks what you are here to do (*slide 17*)

Click **number 2, Install my Operating System.** You do not type anything. Just click.

10. It asks which system you bought (*slide 18*)

Click the one that is you: **number 1, Real estate agents and lenders,** or **number 2, Coaches, consultants and everyone else.**

11. It asks about the form (*slide 19*)

Click **number 1, Yes, submitted.**

12. It asks permission. Say yes every time. (*slide 20*)

A box says *Allow Claude to run...*

- **Always click Always allow.** It is the middle button.
- **Never click Deny.**
- This happens several times. Same answer every time.

The video shows Homebrew. Your system does not use it any more. (*slides 21 to 31*)

Slides 21 to 31 of the video walk through installing something called Homebrew: copying a command, opening Terminal, typing your password into a box that shows nothing, waiting several minutes, then pasting three more lines. Skip every one of them.

That is no longer how this works. BOSS installs the one tool it needed Homebrew for, by itself, in the background. You will not open Terminal, you will not copy a command, and you will not paste anything.

You will not be asked for your password either. The old way needed it. This one does not. If anything ever asks you to paste a command into Terminal during this install,

something has gone wrong: stop, screenshot it, and bring it to office hours.

Then carry on at step 13 below, which is slide 32 in the video.

Getting your system onto the machine

13. It checks its work (slide 32)

A box comes up asking to check what is already on your computer. Click **Always allow**.

The video says *Verify Homebrew is now installed and working* here. Yours will not say that. Homebrew is gone from this install; the wording is the only thing that changed.

14. It installs the GitHub tool (slide 33)

A box comes up asking to install the GitHub tool. Click **Always allow**. About a minute. Let it run.

It downloads about 14 MB into your own user folder. No password, no Terminal, nothing to click through.

The video says *Install GitHub CLI via Homebrew*. Yours will not mention Homebrew.

15. It gives you a code (slide 34)

A code in big red letters, like `9247-D52F`. Write it down or leave the window open. If it says the code expired when you type it, tell BOSS: the code expired. It gives you a new one.

16. Open `github.com/login/device` (slide 35)

New tab. Type `github.com/login/device`.

17. Make sure it is YOUR account (slide 36)

The page says **Device Activation** and **Signed in as [your name]**.

- Your GitHub name? Click the green **Continue**.
- Wrong name? Click **Use a different account** and sign in as you.

18. Type in your code (slide 37)

Eight little boxes appear. Type the code. The dash is already there. Click the green **Continue**.

19. Look for the green check mark (slide 38)

The page says **Authorize GitHub CLI**. Scroll down to **Organization access**.

Krista-Mashore-Coaching with a green check means you are in.

No green check? Screenshot it and bring it to office hours, the call, or the Facebook group.

20. Scroll all the way down *(slide 39)*

The yellow box about your location is normal. Ignore it. Keep scrolling, the button is at the bottom. Click the green **Authorize github**.

You did it when it says **Congratulations, you're all set!** *(slide 40)*

21. Back to Claude, click Done *(slide 41)*

Click number 1, Done. Then one more **Always allow** on *Configure git credentials and check access*. *(slide 42)*

22. It names your folder *(slide 43)*

BOSS says **You're in**, then tells you the folder it is using. It builds the name from your business name, so there is nothing to choose and nothing to get wrong.

The name is **BOSS-OS-** plus your business name, like `BOSS-OS-smith-lending`. Your private backup gets the same name. It is called BOSS, so the folder is named BOSS.

The video shows a menu here asking you to pick a name. You will not see it.

Note down the folder name it gives you. You need it in three steps. *(slide 44)*

23. One more Always allow *(slide 45)*

The box says *Clone the Operating System repo*. Click **Always allow**.

24. It is on your machine *(slide 46)*

About 130 skills just landed in your folder. BOSS gives you a path in a little box. **Click the copy icon on that box.**

Opening your system

25. Click New session *(slide 47)*

26. Click the folder button at the bottom *(slide 48)*

Look at the bottom where it says **Local**. Click the folder button next to it.

27. Paste the path. Click Open. *(slide 49)*

- **Easy way:** paste the path you copied, **Command + V**
- **Or:** on the left, click your name with the house icon, then **Sites**, then your folder

Click the blue **Open**.

28. Click Trust workspace *(slide 50)*

A box says *Trust this workspace?* Check that the path is YOUR folder. Click the black **Trust workspace**.

29. Check the top of the window (slide 51)

It should say **Agent-Authority-Operating-System** or **Authority-Operating-System**, depending on which one you chose. That is right. That is its real name.

30. Type: set up my OS (slide 52)

This one takes 45 to 60 minutes.

- It finds the Business Brain you built in Part 1 and carries everything over
- **You will not answer the same question twice**
- Answer the questions. Keep clicking **Always allow**.

31. It asks about your calendar and email (slide 53)

Which calendar do you actually open day to day? Click **Google Calendar** or **Outlook**. Same for email.

Pick the one you really use, not the one you have heard of.

32. Your private backup happens by itself (slides 54 and 55)

You will see one sentence go by: "**Your work is now backed up privately. Only you can see it.**" That is the whole thing. There is nothing to approve, nothing to name, and nothing to confirm.

Slides 54 and 55 in the video show being asked about the backup, and being asked a long technical question about history. **You should not see either one.** If you do, something has gone wrong: screenshot it, say no for now, and bring it to office hours. Do not try to answer it.

Keep your computer on

BOSS runs things on a schedule: your morning brief, and the jobs built into your kit. A sleeping computer runs nothing, scheduled or not. BOSS asks whether this is a desktop or a laptop, then sets your computer to stay awake by itself. On a Mac, it installs a small stay-awake helper. No password needed.

On a laptop: keep it plugged in and the lid open when you want things to run. A closed lid is asleep, scheduled or not. With the lid closed, nothing runs, and no phone, website, or "select repository" session can stand in for it, so plan on leaving it open when something is scheduled.

33. Now let's get Obsidian (slides 56 to 60)

Say yes when BOSS asks. Obsidian is a window that lets you see and read all your files. **Nothing lives inside it.** Your files are already on your computer.

BOSS installs it for you. You do not download anything.

Slides 57 to 60 in the video show going to a download page, opening the file, and clicking through an installer. **Skip all of it.** BOSS fetches Obsidian straight from the people who make it and installs it itself. There is no browser, no download arrow, no dragging, and no "are you sure this is safe" box.

Just wait. It takes about a minute, and BOSS tells you when it is done.

34. Click Open folder as vault (slide 61)

A start screen comes up with a few choices.

Already have Obsidian open on something else? (slide 62) Look at the very bottom left corner, click the vault name, click **Manage vaults**, then **Open folder as vault**.

35. Find your folder the fast way (slide 63)

- Type your folder name in the search box at the top right
- Your folder shows up. Click it.
- Click the blue **Open**

You should see **00-Intake**, **Agent-OS**, **CLAUDE** and **README** inside. That is the right one.

36. Click Trust author and enable plugins (slide 64)

One box pops up. Click that button.

37. This is your business now (slide 65)

Every file on the left is part of your system. Your brand, your offers, your scripts, your frameworks, your skills.

All of it is on your computer. You own it.

You are done

Nothing else to install. Nothing else to download. Open BOSS tomorrow and ask it to do one thing for you.

It updates itself

Every time you open BOSS it brings in Krista's latest version and installs it. You never do anything. A brand-new release takes open, close, open. If you ever want to force it, say: check for updates.

Stuck?

1. **Screenshot it.**
2. **Give the screenshot to BOSS and ask it to fix itself.**
3. **Still stuck?** Office hours, the call, or the Facebook group. Say which step number you are on and post the screenshot.

Do not email. The three above are faster and they are what we are here for.
